

Mineral Balance IV

Cellular environment is very important in the overall health of a cell and the body as a whole. Maintaining proper acid/base balance within the cell and surrounding tissue is key to optimal health. Normal intracellular pH should be around 7.0. Many studies show that when the pH drops into an acidic range (<7.0), that can be a causal factor for the development of degenerative conditions. This occurs mainly due to poor diet and exercise, toxicity and lack of oxygen. When oxygen fails to enter the cell, the cell's ability to control its pH is lost and the cell becomes acidic. The cell is unable to use adequate oxygen and switches to abnormal metabolism in which the cell converts glucose to lactic acid. This lactic acid is the primary reason for the decrease in pH and disruption of normal cell metabolism.

Cancer cells and other abnormal cells thrive and flourish within this environment. That is why it is so important to try to re-establish optimal pH of the cell. The Mineral Balance IV is one of the best ways to increase the pH of the cell. It contains a mineral called cesium, which has an extremely high pH and is capable of increasing the intracellular environment of the abnormal cell very quickly. The chemical composition makes it extremely absorbable by the cancer cell, and then it reacts quickly by increasing intracellular pH. This creates a very inhospitable environment for the cancer cell to proliferate.

Dr. H. E. Sartori treated 50 terminally ill cancer patients at Life Sciences Universal Medical Clinic in Rockville Maryland and Washington DC using cesium chloride as the main treatment. There was a 50% recovery from cancer in these patients. Patients also noted resolution of pain after the cesium treatments. Another notable finding was the absence of tumors from the autopsies of 13 patients. This indicates the ability of cesium to shrink the tumor. Other studies show similar findings in animal experimentation, where mice that were fed cesium showed significant shrinkage of tumors within 2 weeks.

The Mineral Balance IV is also useful for a number of conditions, in which an acidic environment prevails, such as: MS, ALS, Parkinson's, arthritis, chronic fatigue, osteoporosis and fibromyalgia.

Some people may experience "flu-like" symptoms after the first few IV's. Another common side effect is tingling sensation around the lips and nose. This can be avoided by increasing potassium supplementation and water consumption.
